

INCOMPATIBILITY SURVEY AMONG HORTICULTURAL PLANTS

S. H. NELSON

*Department of Horticulture, University of Saskatchewan,
Saskatoon, Saskatchewan*

Introduction

The problem of scion varieties failing to make satisfactory growth when budded or grafted to certain rootstocks has been confronting nurserymen and growers for years. Grafting would seem to date back to antiquity. The early heterogenous combinations attempted were recognized as unsuitable in pre-biblical days (212) and also mentioned in early Chinese writings (43). The phenomenon of incompatibility, also known by the synonyms of uncongeniality or lack of affinity, has been common in a number of genera but more publicity has been given to fruiting trees, possibly because of the economic importance.

This survey was undertaken by the author for the International Plant Propagators' Society, Eastern Region, and partly financed by the organization. It was initiated by canvassing the membership in both the Eastern and Western Regions. As shown in the bibliography, many usable returns were obtained, but the survey was supplemented to a large extent by a search of the literature.

It is not the intention of the author to duplicate the work of excellent reviews on the subject in earlier years. Emphasis has been placed on the period beginning in 1960 but certain earlier references have been cited to fill in information and to establish a trend of thought on incompatibility. To reduce the length of bibliography, free use of other review papers has been made. In particular, two excellent reviews, one by Argles (8) in 1937 (194 references); and one by Mosse (173) in 1962 (133 references) were used extensively. Although not proficient in languages other than English, a book by Hass and Hildebrandt (66) in German was reviewed and it is an up-to-date review in that language.

Admittedly, the survey is incomplete but a survey of this nature can never be complete with obscure journals and new information being encountered continuously. It is hoped, however, that the compilation of information will be of interest and aid to the propagator.

Literature Review

It is only natural that the first classification of incompatibility was made on external appearances. Briefly, Argles (8) classified them as follows: no union, low percentage of union, high degree of decline and mortality or breakage during normal life-span, ill health, dwarf and stunted trees, and swollen unions. Also in 1937, Chang (43) noted other external symptoms which included late bud break, early defoliation, defoliation started at tip instead of base, gummosis on

Prunus, decline in annual wood production, decline in root growth, and smaller scion/root ratio.

Obviously, these observations and classifications used in the earlier reports need not only be caused by incompatibility. No union and low percentages can be mechanical difficulties caused by the nature of the wood (277), diameter of rootstock (46), nature of the bud (277), and type of propagation (194) 231. Environmental factors (11) and season (281) affect nursery stands as well as the occurrence of soil-borne diseases (3, 49) and insects (49) in the graft area. The treatment of grafts, such as, callusing (98, 99, 137), stratification (167), the use of growth substances to increase success (167, 210), the use of various binding materials (10, 90, 281), the use of various antidissecants (90, 98) and leaving buds on the stock (142) play a part in bud and graft survival. In fact, although waxing of grafts has been a common practice, it was recently discovered that one of the waxes used contained an inhibitory substance (216). Add to these the practice by some propagators of shading (99) or protecting new grafts with polyethelyene (191) and it is easy to see that grafting success can vary widely among different propagators. Even though percentage take is still the index used by many propagators for their definition of incompatibility, it cannot be very well substantiated (173).

Although some anatomical and histochemical attributes of incompatibility were reported by Chang (43), the internal aspects were studied more in later years. From 1937-1961 considerable literature was published and Mosse (173) reassessed the causes of incompatibility, particularly those referred to as "delayed incompatibility". During that period, the fact that certain types of incompatibility could be transmitted became known. Although other new classifications were reported by Mosse in her review (173), she postulated, from the literature and her own work, a very simple classification based on "translocated" and "localized" types of incompatibility. Basically, the division is based on the criteria that translocated types could not be corrected by an inter-stem, while the localized type depends on contact and could be corrected by a mutually compatible inter-stem. She also points out, however, that a graft combination may be afflicted by both types and that manipulations to overcome the one that is visible may only make the other apparent.

Certainly some of the immediate causes of incompatibility was mechanical weakness at the union and Chang (43) in his review cites wood and bark discontinuity, parenchymatous tissue accumulation at the union which may later collapse and from lacunae, and incurved layers of cells at the union which caused clean breaks when the union was placed under stress. Mosse (173) cites reports of clean breaks because of discontinuity in a number of species including apple, pear, plum, apricot, citrus, oak, beech, conifers, and various ornamental

plants. The underlying cause of this discontinuity is not specified in the literature but toxins, as exemplified by prunasin in Quince (209) causing similar discontinuity between pear and quince, could be the reason. Resins in coniferous material may act as a barrier to a solid union (279). Similarly, suberin in the bark area of Douglas Fir has caused discontinuity (53). Even though current wood in certain *Prunus* grafts may be normal, gummosis and the gelatinization of middle lamella may give subsequent breakage at the union. Certainly, lack of lignification and the formation of a mutual middle lamella at the union (30) the irreversible fixation of hydrolysed lignin materials (29), and polyphenoloxidase activity (92) at the union are other reasons for this weakness.

In early reports (43), starch accumulation at the union was cited as proof of discontinuity of the tissue. In citrus, however, there appeared to be no correlation of starch accumulation and various compatibilities (165). Certainly starch accumulations do sometimes occur on either side of the union (43, 134) but this has been proven to be blockage of conducting tissue rather than discontinuity of the tissue as previously thought (173), 222). Conductance of other manufactured foods (245), nutrients (72, 245) and water (54) are also effected.

Recently, virus diseases have been associated with some of the "delayed incompatibility" symptoms of ill-health, die-back, and death (173). Because virus-free components behave normally, Mosse (173) does not consider virus susceptibility of one of the components as true incompatibility. It is a problem, however, that confronts the nurserymen and should be discussed. One of the early reports (91) suggests that there may be more than one virus and this is a well-known fact now with a number of virus being described (188, 275). There is no doubt that virus is a serious problem and has become widespread in all the fruit growing countries (14, 204, 275, 276), but possibly all of the disorders quickly attributed to virus by horticulturists is not correct as exemplified by pear decline (173) or structural weakness (187). Furthermore, plants show a great variability to decline (13, 22) and in some instances virus infection may not noticeably effect performance of production (35). Also of interest, is the fact that two virus infected, but obviously tolerant components, show no symptoms similar to incompatibility, whereas either grafted to a virus-free, susceptible component will bring about death of the unit (2). Virus spread through clonal rootstocks is well recognized but spread by contaminated grafting tools has also been reported even where normal sap transfer has not been successful (87).

Other aspects of incompatibility that tend to confuse is the fact that certain combinations may prove compatible at one location and not at another (173). Minor varietal mutations have been suggested in explanation (173) but geographi-

cal location of the scionwood (132) and the effect of temperature on virus activity (4) has also been suggested. Geographical location and the effect of growing season as well as varietal differences in the time of starch accumulation (89) is also thought to affect incompatibility. This in turn could affect frost hardiness and incompatible combinations are considered less hardy (134, 135) and could further contribute to their early death.

It has been reported that varieties change as exemplified by the Conference pear in England becoming more incompatible with Quince (151). Still more confusing, however, is the fact that three mutually compatible plant materials when worked in any combination of two will be satisfactory but incompatible when all three are put together in one unit (104). Likewise, reciprocal grafts may behave quite differently (152).

Some incompatibility is considered to be based on genetic characteristics (126, 175, 205) and others not (13, 136). D.N.A., however, as associated with virus incompatibility, is high in the scions of incompatible varieties (283) and it is possible that studies in cell biology and cell chemistry may shed new light on incompatibility in the future.

Incompatibility studies have been primarily trial and error. There are, however, certain indices that have been suggested recently. These include seriological methods of protein type analyses (70), analyses of polyphenoloxidase activity (92) downward transportation of radio-active phosphorus (164), rate of transpiration (92), and ratio of scion-rootstock growth (43). One index often thought to be a factor is small-fruited species but this does not seem to be so (136).

Graft Combinations in Survey

The information was received in many forms and also was derived from many sources. With apologies to the 'true botanists' among the readers, an attempt has been made to classify the information according to genera and species. In some cases, however, the term 'unspecified' has had to be used because the donor could not supply further information, the origin was unknown or the original information was not readily available in the English language. It is hoped, however, that the reader will recognize the material pertinent to him even though it may not be fully classified botanically.

Such a review is a never ending task and in the ten days reserved for final preparation, new information has come to light. Furthermore, it is impossible to conceive that any such review would ever be a complete coverage of all literature. For this review, the main sources of horticulture literature was used and heavy use was made of Horticultural Abstracts. The survey was restricted to the horticulural field but many more references could have been obtained if the field of forestry had been explored.

In the presentation, clonal rootstocks, where known, were specified and others are assumed to be of seedling origin. Interstem and top-worked combinations are denoted under the rootstock heading using the usual oblique (/) mark between the component parts. For simplicity and reduction of space the scion varieties are sorted according to genera and then subdivided by rootstocks presented in alphabetical order.

LIST OF COMBINATIONS

<i>ROOTSTOCK</i>	<i>SCION</i>	<i>REMARKS</i>
<i>ABIES.</i>		
<i>Abies cephalonica</i>	<i>A. unspecified</i> (116)	Better than <i>A. alba</i> and <i>A. nordmanniana</i>
<i>Abies concolor</i>	<i>A. concolor nana</i> (263), <i>A. concolor</i> 'selections' (185)	
<i>Abies frazieri</i>	<i>A. unspecified</i> (156)	
<i>Abies nobilis</i>	<i>A. lasiocarpa arizonica</i> (26)	
<i>ACER.</i>		
<i>Acer cappadocicum</i>	<i>A. lobelli</i> (116)	
<i>Acer cornaceum</i>	<i>A. nigrum</i> (116)	
<i>Acer ginnala</i>	<i>A. platanoides</i> 'Crimson King' (277), <i>A. saccharinum</i> (277)	Unsuccessful
<i>Acer negundo</i>	<i>A. platanoides</i> (243) <i>A. platanoides</i> 'Crimson King' (277) <i>A. saccharinum</i> (243, 277), <i>A. saccharum</i> (277)	Unsuccessful Shields knitted, buds failed No take
<i>Acer nigrum</i>	<i>A. nigrum ascendens</i> (74)	
<i>Acer palmatum</i>	<i>A. japonica aureum</i> (263) <i>A. nigrum</i> (38), <i>A. palmatum atropurpureum</i> (38, 185), <i>A. p. 'Burgundy Lace'</i> (7), <i>A. p. dissectum</i> (32, 38, 156, 263), <i>A. p. unspecified</i> (7, 34, 97, 215), <i>A. rubrum</i> 'Ashi-Beni' (36, 185), <i>A. r. 'Bloodgood'</i> (38, 185), <i>A. unspecified</i> (97)	Poor Union
<i>Acer palmatum atropurpureum</i>	<i>A. rubrum</i> 'Ashi-Beni' (131), <i>A. r. 'Bloodgood'</i> (131), <i>A. r. 'Buddi'</i> (131)	Satisfactory – suspect virus
<i>Acer platanoides</i>	<i>A. lobelli</i> (116) <i>A. platanoides</i> (155, 185), <i>A. p. erectum</i> (74), <i>A. p. 'Crimson King'</i> (155), <i>A. p. schwedleri</i> (155), <i>A. p. 'Pyramidal'</i> (155), <i>A. p. variegatum</i> (74)	Poor
<i>Acer pseudo-platanus</i>	<i>A. nigrum</i> (116), <i>A. pentaphyllum</i> (116)	
<i>Acer rubrum</i>	<i>A. franchetti</i> (116) <i>A. rubrum</i> (97), <i>A. saccharinum</i> (75) <i>A. saccharinum</i> (32)	Few incompatibilities
<i>Acer saccharinum</i>	<i>A. hircinum</i> (116) <i>A. platanoides</i> 'Crimson King' (211) <i>A. platanoides</i> 'Crimson King' (277), <i>A. saccharum</i> (277) <i>A. rubrum</i> (221) <i>A. rubrum</i> (211)	Dwarfs Stock bark overgrows bud Delayed incompatibility Dwarfs

ROOTSTOCK	SCION	REMARKS
	<i>A. rubrum</i> unspecified varieties (97) <i>A. saccharinum</i> 'Blairs' (185), <i>A. s.</i> 'Improved' (185), <i>A. s.</i> 'iPyramidal' (185), <i>A. s.</i> 'Skin- neri' (185) <i>A. saccharum</i> (277)	
<i>Acer saccharinum</i> <i>wieri</i>	<i>A. saccharinum</i> <i>wieri</i> <i>laciniatum</i> (194)	Seems to take but fails within year
<i>Acer saccharum</i>	<i>A. hircinum</i> (116) <i>A. nigrum</i> (32) <i>A. nigrum ascendens</i> (74), <i>A.</i> <i>nikoense</i> (74) <i>A. platanoides</i> varieties (263) <i>A. saccharum columnare</i> (74), <i>A. saccharum</i> varieties (32), <i>A. senacaensis</i> (74)	Incompatible Unsuccessful
<i>Acer tataricum</i>	<i>A. palmatum</i> varieties (263)	Poor Union
ACTINIDIA		
<i>Actinidia</i> unspecified	<i>A. unspecified varieties</i> (97)	
AESCULUS		
<i>Aesculus hippocastanum</i>	<i>A. camea</i> (142, 185), <i>A. c. briotii</i> (74, 142, 185, 263), <i>A. hippocastanum</i> (97), <i>A. h. plena</i> (142), <i>A. parviflora</i> (142)	
ALNUS.		
<i>Alnus</i> unspecified	<i>A. unspecified varieties</i> (97)	
AMELANCHIER		
<i>Aronia melanocarpa</i>	<i>A. canadensis</i> (277)	Seemed to take, failed overwinter
<i>Crataegus crus-galli</i>	<i>A. grandiflora</i> (185)	Incompatible
<i>Crataegus oxyacantha</i>	<i>A. grandiflora pubescens</i> (185)	
<i>Crataegus</i> unspecified	<i>A. alnifolia</i> cultivars (266), <i>A. unspecified varieties</i> (97)	
<i>Cotoneaster acutifolia</i>	<i>A. canadensis</i> (277)	Shield took, buds failed
<i>Malus pumila</i>	<i>A. alnifolia</i> cultivars (266) <i>A. canadensis</i> (277) <i>A. grandiflora</i> (185)	Shield took, buds failed
<i>Pyrus communis</i>	<i>A. canadensis</i> (277)	Incompatible
<i>Sorbus</i> unspecified	<i>A. alnifolia</i> cultivars (266), <i>A. unspecified</i> (97)	No take
AMPELOPSIS		
<i>Parthenocissus</i> unspecified	<i>A. unspecified varieties</i> (97)	

ROOTSTOCK	SCION	REMARKS
ARALIA:		
<i>Aralia</i> unspecified	A. unspecified varieties (97)	
ARISTOLOCHIA:		
<i>Aristolochia</i> unspecified	A. unspecified varieties (97)	
ARONIA		
<i>Amelanchier</i> <i>candensis</i>	<i>A. melanocarpa</i> (277)	No take
BAUHINIA		
<i>Bauhinia</i> <i>purpurea</i>	<i>B. blakiana</i> (7)	
BERBERIS		
<i>Berberis</i> . <i>thunbergii</i> <i>atropurpurea</i>	B. unspecified evergreen varieties (97)	
<i>Berberis</i> <i>vulgaris</i> <i>atropurpurea</i>	B. unspecified evergreen varieties (97)	
BETULA.		
<i>Betula</i> <i>alba</i>	<i>B. nigra</i> (263), <i>B. pendula</i> (156)	
<i>Betula</i> <i>lutea</i>	<i>B. pendula</i> (156)	
<i>Betula</i> <i>papyrifera</i>	<i>B. pendula</i> (156)	
CAMILLIA		
<i>Camillia</i> <i>japonica</i>	<i>C. reticulata</i> (238)	Delayed incompati- bility
	C. unspecified (215)	
<i>Camillia</i> <i>reticulata</i>	<i>C. reticulata</i> (238)	
<i>Camillia</i> <i>saluenen-</i> <i>sis</i> x <i>C. japonica</i>	<i>C. reticulata</i> (238)	
CARAGANA		
<i>Caragana</i> <i>arborescens</i>	<i>C. arborescens pendula</i> (263)	
CARPINUS		
<i>Carpinus</i> <i>betulus</i>	<i>C. betulus</i> (97)	
<i>Carpinua</i> <i>caroliniana</i>	<i>C. betulus fastigiata</i> (74, 263)	
CARYA		
<i>Carya</i> unspecified	C. unspecified (97)	
<i>Juglans</i> <i>nigra</i>	C. unspecified (97)	
CASTANEA.		
<i>Castanea</i> <i>crenata</i> 'Gin-Yose'	<i>C. crenata</i> 'Gin-Yose' (4) <i>C. mollissima</i> 'Boji' (4)	Incompatible
<i>Castanea</i> <i>crenata</i> 'Shibaguri'	<i>C. crenata</i> 'Gin-Yose' (4) <i>C. mollissima</i> 'Boji' (4)	Incompatible
<i>Castanea</i> <i>mollissima</i>	C. unspecified (97)	
<i>Castanea</i> <i>mollissima</i> 'Miyagawa 20'	<i>C. crenata</i> 'Gin-Yose' (4), <i>C. mollissima</i> 'Boji' (4)	

<i>ROOTSTOCK</i>	<i>SCION</i>	<i>REMARKS</i>
<i>Castanea sativa</i>	<i>C. sativa</i> (194)	
<i>Castanea sativa M15</i> (clonal)	<i>C. sativa</i> 'Boriche rouge' (194)	Delayed incompatibility
CATALPA		
<i>Catalpa speciosa</i>	<i>C. unspecified</i> (97)	
CEDRUS.		
<i>Cedrus atlantica</i>	<i>C. atlantica aurea</i> (263), <i>C. a. fastigiata</i> (263), <i>C. a. glauca</i> (263), <i>C. a. pendula</i> (263)	Weak Unions
<i>Cedrus deodara</i>	<i>C. atlantica</i> (215), <i>C. a. aurea</i> (263), <i>C. a. fastigiata</i> (263), <i>C. a. glauca</i> (38, 57, 156, 263), <i>C. a. pendula</i> (263), <i>C. deodara aurea</i> (263), <i>C. d. pendula</i> (263), <i>C. libani</i> (40, 263)	
CELTIS		
<i>Celtis unspecified</i>	<i>C. unspecified</i> (97)	
CHAENOMELES.		
<i>Chaenomeles japonica</i>	<i>C. japonica</i> (71)	
<i>Sorbus aucuparia</i>	<i>C. japonica</i> (71)	50% take
<i>Sorbus unspecified</i>	<i>C. unspecified</i> (279)	
CHAMAECYPARIS		
<i>Chamaecyparis lawsoniana</i>	<i>C. nootkatensis</i> (238)	Failed to unite
	<i>C. obtusa aurea nana</i> (40), <i>C. o. gracilis nana</i> (170), <i>C. o. 'Minima'</i> (40)	
<i>Chamaecyparis lawsoniana allumii</i>	<i>C. obtusa crippsii</i> (131), <i>C. o. nana</i> (131), <i>C. o. n. compacta</i> (131)	
<i>Chamaecyparis obtusa</i>	<i>C. lawsoniana stewartii</i> (38), <i>C. obtusa aurea</i> (263), <i>C. o. compacta</i> (263), <i>C. o. crippsii</i> (263), <i>C. o. filicoides</i> (263), <i>C. o. gracilis</i> (38, 263), <i>C. o. g. nana</i> (38, 263), <i>C. o. nana</i> (263), <i>C. o. tetragona</i> (263)

	<i>P. borbonia</i> (83), <i>P. caerulea</i> (83), <i>P. chrysophylla</i> (83), <i>P. donnell-smithii</i> (83), <i>P. durifolia</i> (83), <i>P. indica</i> (83), <i>P. lingue</i> (83), <i>P. palustris</i> (83), <i>P. portoricensis</i> (83), <i>P. skutchii</i> (83)	

<i>ROOTSTOCK</i>	<i>SCION</i>	<i>REMARKS</i>
PHILADELPHUS.		
<i>Philadelphus coronarius nana</i>	<i>P. coronarius</i> (277)	No take, difficult to work
PHILLYREA		
<i>Ligustrum vulgaris</i>	<i>P. unspecified</i> (97)	
PHOTINIA		
<i>Crataegus unspecified</i>	<i>P. unspecified</i> (97)	
<i>Cydonia oblonga</i> 'Provence' (clonal)	<i>P. glabra</i> (194)	
<i>Cydonia unspecified</i>	<i>P. unspecified</i> 'Toyon' (171), <i>P. unspecified</i> (97)	
<i>Photinia fraseri</i> (clonal)	<i>P. arbutifolia macrocarpa</i> (7)	
<i>Photinia serrulata</i> <i>nova</i> (clonal)	<i>P. arbutifolia macrocarpa</i> (7, 215)	
<i>Pyracantha lalandii</i>	<i>P. unspecified</i> 'Toyon' (171)	
PHYSOCARPUS		
<i>Physocarpus opulifolius nanus</i>	<i>P. opulifolius</i> (277)	No take, difficult to work
PICEA:		
<i>Picea abies</i>	<i>P. abies</i> varieties (263), <i>P. a. inversa pendula</i> (108), <i>P. a. pendula</i> (108), <i>P. a. 'Maxwelli'</i> (108)	
	<i>P. mariana doumeti</i> (263)	Very low take
	<i>P. pungens</i> varieties (263), <i>P. p. glauca globosa</i> (108), <i>P. p. g. 'Hoopsi'</i> (15, 108), <i>P. p. g. 'Kosteriana'</i> (57, 176), <i>P. p. g. 'Moerheimi'</i> (15, 108), <i>P. p. g. 'Montgomery'</i> (108), <i>P. p. unspecified</i> (31, 185, 274)	
<i>Picea abies concolor</i>	<i>P. abies concolor</i> varieties (184)	
<i>Picea excelsa</i>	<i>P. glauca conica</i> (156), <i>P. pungens glauca</i> 'Hoopsi' (38), <i>P. p. g. 'Kosteriana'</i> (158), <i>P. p. g. 'Moerheimi'</i> (38, 158), <i>P. nidiformis</i> (38)	
<i>Picea glauca</i>	<i>P. abies</i> varieties (263), <i>P. pungens</i> unspecified clones (185), <i>P. unspecified</i> (176)	
<i>Picea glauca densata</i>	<i>P. pungens glauca</i> 'Thompson's' (131)	Weak union, suspect virus
<i>Picea sitchensis</i>	<i>P. pungens glauca</i> 'Kosteriana' (57)	
PINUS:		
<i>Pinus densiflora</i>	<i>P. densiflora oculus-draconis</i> (263), <i>P. d. pendula</i> (108), <i>P. d. umbraculifera</i> (108, 263)	
<i>Pinus echinata</i>	<i>P. echinata</i> (183)	
<i>Pinus mugo</i>	<i>P. several species</i> (183)	

<i>ROOTSTOCK</i>	<i>SCION</i>	<i>REMARKS</i>
<i>Pinus nigra</i>	<i>P. bungeana</i> (267), <i>P. cembroides edulis</i> (267), <i>P. densiflora</i> 'Taryesha' (185), <i>P. d.</i> 'Umbrella' (267), <i>P. mugo mughus</i> (267), <i>P. nigra austriaca</i> (156), <i>P. pinaster</i> (267), <i>P. ponderosa</i> (267), <i>P. sylvestris fastigiata</i> (185), <i>P. s.</i> varieties (184), <i>P.</i> (Two and three needle) (183)	
<i>Pinus resinosa</i>	<i>P.</i> (Two and three needle) (183)	
<i>Pinus strobus</i>	<i>P. bungeana</i> (108, 263), <i>P. cembra</i> (15, 38, 108, 156, 263), <i>P. c. glauca</i> (263), <i>P. cembroides monophylla</i> (263), <i>P. flexilis</i> (184, 185, 263), <i>P. f. glauca pendula</i> (263), <i>P. griffithi</i> (108, 263), <i>P. koraiensis</i> (108), <i>P. parvifolia</i> (38, 156), <i>P. p. glauca</i> (108, 263), <i>P. peuce</i> (108), <i>P. strobus</i> (184), 185,) <i>P. s. brevifolia</i> (108), <i>P. s. fastigiata</i> (38, 156), <i>P. s. nana</i> (108), <i>P. s. pendula</i> (108), <i>P. s. torulosa</i> (108), <i>P. s. umbraculifolia</i> (108), <i>P.</i> (Five needle) (183)	
<i>Pinus sylvestris</i>	<i>P. bungeana</i> (263) <i>P. sylvestris</i> clones (15), <i>P. s. fastigiata</i> (273) <i>P. sylvestris fastigiata</i> (263) <i>P. sylvestris glauca compacta</i> (263), <i>P. s. g. globosa</i> (108), <i>P. s.</i> 'Riverside Gem' (263), <i>P. s.</i> 'Watereri' (108, 263), <i>P.</i> (Two and three needle pines) (183)	Delayed incompatibility Often poor union
<i>Pinus thunbergii</i>	<i>P. densiflora pendula</i> (108), <i>P. d. umbraculifera</i> (108)	
PISTACIA		
<i>Pistacia lentiscus</i>	<i>P. vera</i> 'Kerman' (239), <i>P. v.</i> 'Lassen' (239), <i>P. v.</i> 'Sfax' (239)	Low take and dwarfing
PLATANUS.		
<i>Platanus occidentalis</i>	<i>P. occidentalis</i> clones (152)	Delayed incompatibility
PONCIRUS.		
<i>Citrus mitis</i>	<i>P. trifoliata</i> (83)	
POPULUS:		
<i>Populus balsamifera</i>	<i>P. alba pyramidalis</i> (120)	
<i>Populus alba nivea</i>	<i>P. tremuloides</i> (194)	
<i>Populus nigra italicica</i>	<i>P. alba pyramidales</i> (97, 185)	
<i>Populus robusta</i>	<i>P. lasiocarpa</i> (194)	

ROOTSTOCK	SCION	REMARKS
PRUNUS		
<i>Prunus americana</i>	<i>P. avium</i> unspecified (56) <i>P. cerasus</i> 'Coronation' (56), <i>P. c.</i> 'Montmorency' (56) <i>P. cerasus</i> 'North Star' (56) <i>P. cerasus</i> 'Wragg' (56) <i>P. mandshurica</i> 'Anda' (56), <i>P. m.</i> 'm. Robust' (56), <i>P. m.</i> 'Scout' (56), <i>P. m.</i> 'Sing' (56) <i>P. tenella</i> hybrid (56) <i>P. tomentosa</i> 'Drilea' (56)	No take Low take, weak union
	<i>P. tomentosa</i> 'Orient' (56) <i>P. tomentosa</i> x <i>P. besseyi</i> 'Eileen' (56), <i>P. triloba</i> (56), <i>P. t.</i> x <i>P. pedunculata</i> 'Mor- den Almond' (56), <i>P. t.</i> x <i>P. p.</i> 'Prairie Almond' (56), <i>P. virgin- iana</i> 'Shubert' (56)	No take Low take, delayed incompatibility
<i>Prunus amygdalus</i> (<i>communis</i>)	<i>P. armeniaca</i> 'Alawi' (239), <i>P. a.</i> 'Beladi' (239), <i>P. a.</i> 'Canino' (239), <i>P. a.</i> 'Hatif de Colomer' (239) <i>P. armeniaca</i> 'Hungarian' (242) <i>P. triflora</i> (239)	Weak, excessive break- age, incompatible Better success with <i>P. a.</i> 'Alawi' and <i>P. a.</i> 'Beladi' grafted high
<i>P. amygdalus</i> x <i>P. persica</i>	<i>P. amygdalus</i> (127), <i>P. persica</i> (127)	Not as good as apricot
<i>Prunus armeniaca</i>	<i>P. armeniaca</i> 'Hungarian' (242) <i>P. unspecified</i> plum varieties (246)	Decline and death, unions imperfect especially on <i>P. t.</i> 'Ogden' and <i>P. t.</i> 'Beauty'
<i>Prunus armeniaca</i> 'Hindukusek'	<i>P. persica</i> unspecified (257)	Some varieties incom- patible
<i>Prunus armeniaca</i> 'Marablin'	<i>P. armeniaca</i> 'Falca Rosey' (145)	
<i>Prunus avium</i>	<i>P. avium</i> 'Leningradskaja' (133), <i>P. a.</i> 'Leningradskaja Cernaja' (133), <i>P. maacki</i> (116), <i>P. ser- rula</i> (116), <i>P. serrulata</i> 'Aman- gawa' (142), <i>P. s.</i> 'Fugenso' (142), <i>P. s.</i> 'Hokusai' (142), <i>P.</i> <i>s.</i> 'Kiku-Shidare' (142), <i>P. s.</i> 'Kwanzan' (142), <i>P. s.</i> 'Miyako' (142), <i>P. s.</i> 'Shogetsu' (142), <i>P. s.</i> 'Takasago' (142)	
<i>Prunus avium</i> 'Mazzard'	<i>P. serrulata</i> (194)	Poor budding, good grafting
<i>Prunus avium</i> 'Mazzard 12/1' (clonal)	<i>P. serrulata</i> (156) <i>P. autumnalis</i> (254) <i>P. avium duracina</i> (194) <i>P. sargentii</i> (254), <i>P. serrulata</i> (254)	Low take by budding, grafting alright

ROOTSTOCK	SCION	REMARKS
	<i>P. serrulata</i> 'Amanagawa' (254), <i>P. s.</i> 'Kiku Sakura' (254), <i>P. s.</i> 'Kwanzan' (254), <i>P. s.</i> 'Myako' (254), <i>P. s.</i> 'Pink Per- fection' (254), <i>P. s.</i> 'Shiro Fugens' (254)	Intolerant to virus

<i>Pyrus ussuriensis</i>	<i>P. unspecified</i> (22)	Red-leaf susceptible
<i>Pyrus unspecified</i> 'Wild Pear'	<i>P. unspecified</i> (13)	Decline susceptible
<i>Sorbus terminalis</i>	<i>P. communis</i> 'Cure' (199)	Red-leaf susceptible
QUERCUS		
<i>Quercus alba</i>	<i>Q. alba</i> group (231), <i>Q. borealis</i> group (177)	
	<i>Q. pontica</i> (80)	<i>Not successful</i>
	<i>Q. velutina</i> group (231)	
<i>Quercus borealis</i>	<i>Q. palustris</i> (214)	
<i>Quercus castaneaefolia</i>	<i>Q. suber</i> (231)	
<i>Quercus cerris</i>	<i>Q. cerris variegata</i> (116)	
<i>Quercus chryssolepis</i>	<i>Q. suber</i> (231)	
<i>Quercus coccinea</i>	<i>Q. coccinea splendens</i> (116)	
<i>Quercus lyrata</i>	<i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	No take in budding but grafting would seem to be successful in some of these combinations
<i>Quercus macrocarpa</i>	<i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	No take in budding but grafting would seem to be successful in some of these combinations
<i>Quercus nigra</i>	<i>Q. regia</i> (116)	Incompatibility after 25 years
	<i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	No take in budding but grafting would seem to be successful in some of these varieties
<i>Quercus palustris</i>	<i>Q. borealis</i> group (231) <i>Q. borealis</i> (80), <i>Q. coccinea</i> (80), <i>Q. imbericaria</i> (80) <i>Q. kelloggii</i> (116) <i>Q. palustris</i> (31) <i>Q. robur fastigiata</i> (263) <i>Q. scochiana</i> (116), <i>Q. texana</i> (116) <i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	Very low bud take Very low bud take Unsatisfactory No take in budding but grafting would seem to be successful in some of these combinations

<i>ROOTSTOCK</i>	<i>SCION</i>	<i>REMARKS</i>
<i>Quercus pedunculosa</i>	<i>Q. pedunculosa fastigiata</i> (142), <i>Q. petraea columnaris</i> (142)	
<i>Quercus pubescens</i>	<i>Q. suber</i> (231)	
<i>Quercus phellos</i>	<i>Q. phellos</i> x <i>Q. ludoviciana</i> hybrids (116)	
	<i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	No take in budding but grafting would seem to be successful in some of these combinations
<i>Quercus regia</i>	<i>Q. regia</i> (116)	
<i>Quercus robur</i>	<i>Q. alba</i> group (177), <i>Q. castanefolia</i> (116) <i>Q. coccinea splendens</i> (80) <i>Q. libani</i> (116), <i>Q. robur fastigiata</i> (263) <i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	Only 25%
		No take in budding but grafting would seem to be successful in some of these combinations
<i>Quercus rubra</i>	<i>Q. coccinea splendens</i> (116)	Not as good as <i>Q. coccinea</i>
<i>Quercus stellata</i>	<i>Q. virginiana</i> (231) <i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	Delayed incompatibility No take in budding but grafting would seem to be successful in some of these combinations
<i>Quercus velutina</i>	<i>Q. alba</i> group (231), <i>Q. velutina</i> group (231), <i>Q. velutina rubrifolia</i> (116)	
<i>Quercus virginiana</i>	<i>Q. virginiana</i> x <i>Q. lyrata</i> 'Ness hybrids' (231)	No take in budding but grafting would seem to be successful in some of these combinations
RHODODENDRON		
<i>Rhododendron catawbiensis</i>	<i>R. catawbiensis</i> varieties (263) <i>R. unspecified</i> varieties (156)	Very poor take
<i>Rhododendron catawbiensis</i> 'Cunningham White'	<i>R. catawbiensis</i> varieties (263), <i>R. unspecified</i> varieties (45, 156)	
<i>Rhododendron decorum</i>	<i>R. fortunei</i> series (45)	
<i>Rhododendron fortunei</i>	<i>R. fortunei</i> series (45)	
<i>Rhododendron luteum</i>	<i>R. gandavense</i> varieties (232), <i>R. molle</i> varieties (50, 232), <i>R. ponticum</i> varieties (50), <i>R. rustica</i> varieties (50)	
<i>Rhododendron maximum</i>	<i>R. unspecified</i> (138)	
<i>Rhododendron molle</i>	<i>R. gandavense</i> varieties (263)	
<i>Rhododendron mucronatum</i>	<i>R. (complex hybrids)</i> 'Belgian' and 'Indian' forcing varieties (232)	
<i>Rhododendron pentaphyllum</i>	<i>R. pentaphyllum</i> (116)	Alright, but delayed incompatibility on other species

ROOTSTOCK	SCION	REMARKS
<i>Rhododendron ponticum</i>	<i>R. caracatum</i> (131), <i>R. catawbiense alba</i> (131), <i>R. c.</i> 'Dr. H. C. Dresselhuy's' (131), <i>R. c.</i> 'English Roseum' (131), <i>R. c.</i> 'Ignatius Sargentii' (131), <i>R. c.</i> 'Lee's Dark Purple' (131), <i>R. c.</i> 'Mrs. C. S. Sargent' (131), <i>R. c.</i> <i>grandiflora</i> (131) <i>R. catawbiense</i> varieties (263)	Weak unions, virus suspected, discontinued
	<i>R. lacteum</i> (116)	Take satisfactory, rootstocks wilt
	<i>R. loderi</i> (116)	Incompatible
	<i>R. unspecified</i> 'Grande' and 'Sinogrande' (116)	Incompatible
	<i>R. unspecified</i> 'Barbaratum', 'Barclayi' and 'Thompsoni' (116)	Difficult
	<i>R. unspecified</i> (138)	Disease problem
	<i>R. unspecified</i> (97, 156)

ZELKOVA.		
<i>Ulmus</i> unspecified	<i>Z. unspecified</i> (97)	

ACKNOWLEDGMENT

The author would be very remiss if the support of the membership and other horticulturists was not acknowledged. Many individuals contributed by answering the questionnaire but the effort put into the contributions of Dr. Harold Pellett, Dr. Richard Zimmerman, Dr. E. F. Frolich, and John and Peter Vermeulen of the United States; Pierre Remi of France; Dr. Spiegel-Roy of Israel; and W. A. Cumming of Canada should not go unnoticed.

To all those who were so tolerant to supply breeding and taxonomic information when approached at various meetings, a sincere 'thank you' is tendered.
